Sergas Bypass Detect Root device

- Today I have download the new Sergas app, but I see this error:

- I have a custom ROM, not a rooted phone and I require to use this app.
 With my simple knowledge of android pentesting, I found a way to bypass this error.
- The first that we need to do is change the .apk extension to .zip and see how many dex files we have.

- We have 3 .dex files, let's make one .jar to read de code later with jd-gui:

d2j-dex2jar.sh -f -o output_sergas_jar.jar sergas.apk

- Use jd-gui to read java code:

Open .jar file generated in previous step.

- Probably one of these functions in method isRooted() return me a false-positive

   👇 🜐 util
  BuildConfig.class
Const.class
R.class
RootBeer.class
RootBeerNative.class
```

```
public boolean isRooted() {
    return detectRootManagementApps() || detectPotentiallyDangerousApps() || checkForBinary(Const.BINARY_SU)
}
```

- Decompile and modify the .smali file:

apktool d -r sergas.apk -o sergas_decompiled

- Solution is so simple, we only need to modify RootBeer.smali:

smali_classes2/com/scottyab/rootbeer/RootBeer.smali_135x26

- Find function *isRooted()* and remplace 0x1(true) to 0x0(false):

```
1071 .method public isRooted()Z
1072 .locals 1
```

...

- Compile app and sign app:

apktool b sergas_decompiled/ -o pwnsergas.apk java -jar uber-apk-signer-1.2.1.jar -a pwnsergas.apk

- This is the result:

- As you can see it's very simple, and doesn't require a bigger acknowledgment of reversing engineering.
